

Infant Formula Mixing Instructions

Kabrita is the first and only European and goat milk-based infant formula brand to meet all FDA requirements for children 0-12 months old

PREPARATION INSTRUCTIONS

Kabrita goat milk-based infant formula is for healthy infants, 0-12 months old. Proper preparation instructions and the recommended feeding schedule can be found on the back of each can.

When clinically necessary, the below measurements can be used to provide different nutritional profile per serving.

Only use the scoop provided in the can. If the scoop from the can is not available, we advise to weigh the formula powder on a gram scale for most accurate measurement.

TOTAL KCAL	WATER VOLUME fluid oz (ml)	KABRITA INFANT FORMULA unpacked scoops (g)
22 kcal	1 fluid oz (~30 ml)	1 scoop (4.5g)
24 kcal	6.5 fluid oz (~192ml)	7 scoops (31.5g)
27 kcal	5 fluid oz (~147ml)	6 scoops (27.0g)
30 kcal	3 fluid oz (~89ml)	4 scoops (18.0g)

NOTE: Household measurements (fl oz = fluid ounce = 29.57ml) are approximations. Gram weights are the most accurate for meeting target caloric density. Final volumes will be slightly higher due to displacement from powder.

Formulation is developed based on the dilution factor 0.135. To reach 100ml formula, 3 scoops (per scoop 4.5g) of powder will be dissolved in 90 ml lukewarm water. It is important to monitor the hydration status, since more calorically dense formula may not supply enough water for some infants.
